Abstract

We study supersymmetric composite generalized quantum integrable models solvable by the Bethe ansatz. Using coproduct in the bialgebra of monodromy matrix elements and their action on Bethe vectors we derive a formula for Bethe vectors in the composite model with supersymmetry based on $\mathfrak{gl}(2|1)$ and $\mathfrak{gl}(1|2)$.

1 Introduction

The main success of the algebraic Bethe ansatz resides in the general prescription how to obtain eigenvectors (famous Bethe vectors) for a vast class of quantum integrable models. Consequently, it enables the calculation of the correlation functions via the calculation of the form factors. The Bethe vectors for the models based on the $\mathfrak{gl}(2)$ algebra and its deformations have a very simple form (see [3, 4, 10, 14, 21] and references therein). However, they become very nontrivial for models based on higher rank (super)algebras.

What is common for Bethe vectors in the models with $\mathfrak{gl}(2)$ and higher rank symmetry (super)algebras is that they belong to the state (super)space \mathcal{H} with the structure of the Fock space. In other words, \mathcal{H} contains a cyclic vector Ω (usually called pseudovacuum) and the Bethe vectors are generated by the action of certain creation-like operators on Ω . These creation-like operators belong to the (super)algebra of matrix elements of the monodromy matrix $T(u)$.

The last years have been marked by considerable progress in finding the "user-friendly" forms of Bethe vectors for higher rank (super)algebras. For $\mathfrak{gl}(3)$ and its quantum deformation Bethe vectors were calculated in [1, 2]. Bethe vectors for the superalgebras $\mathfrak{gl}(2|1)$ and $\mathfrak{gl}(1|2)$ were obtained in [18] and used to calculate the scalar products [7, 8] and the form factors of the monodromy matrix elements [6]. This opens an opportunity to calculate the correlation functions in models with this type of supersymmetry. The t-J model (based on $\mathfrak{gl}(2|1)$) well known from the condensed matter physics is one of the examples of such models.

The next important step in solving the integrable models is to find the correlation functions for local operators. In models for which the solution of the quantum inverse scattering problem [12] is known, such correlation functions are reduced to the calculation of the scalar products

¹E-MAIL: FUKSA@THEOR.JINR.RU

of Bethe vectors [19]. Unfortunately, the solution is known for a very specific class of models only.

For local operators in models which do not possess this property, there is the composite model [10].² Its main idea is that the interval $[0, L]$, on which the original model is defined, is divided into two subintervals $[0, x]$ and $]x, L]$. Consequently, the state (super)space \mathcal{H} of the complete model is divided into two (graded) subspaces $\mathcal{H}^{(1)}$ and $\mathcal{H}^{(2)}$ corresponding to $[0, x]$ and $]x, L]$, $\mathcal{H} = \mathcal{H}^{(1)} \otimes \mathcal{H}^{(2)}$. Simultaneously, the monodromy matrix $T(u)$ is divided into the partial monodromy matrices $T^{(2)}(u)$ and $T^{(1)}(u)$:

$$T(u) = T^{(2)}(u)T^{(1)}(u), \quad (1.1)$$

where the partial monodromy matrices $T^{(\ell)}(u)$ act nontrivially only in the corresponding graded subspaces $\mathcal{H}^{(\ell)}$. This property of the monodromy matrix is related to the coproduct on the bialgebra of the matrix elements of the monodromy matrix $T(u)$.

We suppose that the (graded) subspaces $\mathcal{H}^{(\ell)}$ have also the structure of the Fock space with the partial pseudovacua $\Omega^{(\ell)}$ such that $\Omega = \Omega^{(1)} \otimes \Omega^{(2)}$. The nontrivial fact is that the Bethe vectors $\mathbb{B} \in \mathcal{H}$ of the full model can be represented as bilinear combinations of the partial Bethe vectors $\mathbb{B}^{(1)} \in \mathcal{H}^{(1)}$ and $\mathbb{B}^{(2)} \in \mathcal{H}^{(2)}$. For the models based on the $\mathfrak{gl}(2)$ symmetry this was shown in [10]. The case of $\mathfrak{gl}(3)$ was recently studied in [16]. The subject of this article is to find a similar representation for the models based on the superalgebras $\mathfrak{gl}(2|1)$ and $\mathfrak{gl}(1|2)$.

Such a representation allows one to compute the form factors of the partial monodromy matrix elements $T_{ij}^{(\ell)}(u)$ in the basis of the Bethe vectors of the full model. Based on this, the form factors and correlation functions of local operators can be investigated.

The general strategy of this article is similar to the strategy of the paper [16] on $\mathfrak{gl}(3)$. However, some technical details appear due to different commutation relations. We describe these technical differences. We show how they change calculations for a concrete case, but we do not give all calculations.

The paper is organized as follows. In section 2, basic notions of the $\mathfrak{gl}(2|1)$ -invariant quantum integrable models like the monodromy matrix, the RTT algebra, and the Bethe vectors are introduced, and the notation used further in the article is described. Section 3 describes the $\mathfrak{gl}(2|1)$ -invariant composite model. The main results are formulated in two theorems contained in subsection 3.1. Section 4 deals with some technical details from subsection 3.1. Section 5 is devoted to the $\mathfrak{gl}(1|2)$ -invariant composite models. The main results are again formulated in two theorems contained in section 5.1.

2 Basic notions of the $\mathfrak{gl}(2|1)$ -invariant model

2.1 R-matrix and RTT algebra

The content of this subsection can be easily generalized to superalgebras of other ranks.

²The terminology witnessed a long evolution here. The composite model was originally called the two-site model in [10]. Later the term two-component model was used [20]. Both these terms can lead to confusion in some situations. Therefore, the term composite model was proposed recently [16]. We hold this terminology in our article.

The R-matrix acts in the tensor product of two \mathbb{Z}_2 -graded auxiliary superspaces $\mathbb{C}^{2|1}$. The basis of the even part of $\mathbb{C}^{2|1}$ is $\{e_1, e_2\}$ and of the odd part is $\{e_3\}$. We introduce the parity function $[\] : \{1, 2, 3\} \rightarrow \mathbb{Z}_2$ such that $[1] = [2] = 0$ and $[3] = 1$. The gradation of the superspace $\mathbb{C}^{2|1}$ is thus described by this parity function: $\text{grad}(e_i) = [i]$, $i = 1, 2, 3$.

The matrix units $E_{ij} \in \text{End}(\mathbb{C}^3)$ are introduced in the standard way $(E_{ij})_{ab} = \delta_{ia}\delta_{jb}$ with the gradation $\text{grad}(E_{ij}) = [i] + [j]$. The tensor product is graded in the following way:

$$(E_{ij} \otimes E_{kl})(E_{mn} \otimes E_{pq}) = (-1)^{([k]+[l])([m]+[n])} E_{ij} E_{mn} \otimes E_{kl} E_{pq}. \quad (2.1)$$

The graded permutation (superpermutation) for two auxiliary superspaces [15] is defined using the matrix units

$$P = \sum_{i,j=1}^3 (-1)^{[j]} E_{ij} \otimes E_{ji}. \quad (2.2)$$

The $\mathfrak{gl}(2|1)$ -invariant R-matrix has the explicit form

$$R(u, v) = \mathbb{I} \otimes \mathbb{I} + g(u, v)P \quad (2.3)$$

where \mathbb{I} is the unit matrix in $\mathbb{C}^{2|1}$. The function $g(u, v)$ is antisymmetric and rational

$$g(u, v) = \frac{c}{u - v} \quad (2.4)$$

and $c \in \mathbb{C}$ is an auxiliary constant.

The definition of the monodromy matrix is standard $T(u) = \sum_{i,j=1}^3 E_{ij} \otimes T_{ij}(u)$. The elements $T_{ij}(u)$, $i, j = 1, 2, 3$, together with the unit element $\mathbf{1}$ are generators of the associative superalgebra \mathcal{A} . The monodromy matrix is a globally even matrix due to the fact that $\text{grad}(E_{ij}) = \text{grad}(T_{ij}(u))$. It satisfies the RTT relation with the R-matrix (2.3)

$$R(u, v)(T(u) \otimes \mathbb{I})(\mathbb{I} \otimes T(v)) = (\mathbb{I} \otimes T(v))(T(u) \otimes \mathbb{I})R(u, v). \quad (2.5)$$

The RTT relation is equivalent to the bilinear relations in \mathcal{A} which can be written in two equivalent forms

$$\begin{aligned} [T_{ij}(u), T_{kl}(v)] &= g(u, v)(-)^{[i][j]+[i][l]+[j][l]}(T_{il}(u)T_{kj}(v) - T_{il}(v)T_{kj}(u)) \\ &= -g(u, v)(-)^{[i][k]+[i][l]+[k][l]}(T_{kj}(u)T_{il}(v) - T_{kj}(v)T_{il}(u)) \end{aligned} \quad (2.6)$$

with the supercommutator $[T_{ij}(u), T_{kl}(v)] \equiv T_{ij}(u)T_{kl}(v) - (-)^{([i]+[j])([k]+[l])}T_{kl}(v)T_{ij}(u)$. The superalgebra \mathcal{A} is called the RTT algebra.

There is a coalgebraic structure defined on \mathcal{A} with the following coproduct:

$$\Delta(T_{ij}(u)) \equiv \sum_{k=1}^3 T_{kj}(u) \otimes T_{ik}(u) = \sum_{k=1}^3 T_{kj}^{(1)}(u) T_{ik}^{(2)}(u). \quad (2.7)$$

The superscripts at $T_{ij}^{(\ell)}(u)$, $\ell = 1, 2$, are used to distinguish the two copies of the bialgebra \mathcal{A} . The elements of different copies of \mathcal{A} mutually supercommute $[T_{il}^{(1)}(u), T_{jk}^{(2)}(v)] = 0$. The

partial monodromy matrices $T^{(\ell)}(u)$, $\ell = 1, 2$, satisfy the same RTT relation (2.5) as \mathcal{A} has the structure of bialgebra. It is worth mentioning that the coproduct (2.7) is equivalent to relation (1.1) for the monodromy matrix of the composite model.

Let us remind that there is an antimorphism of \mathcal{A} [18]:

$$\psi(T_{ij}(u)) = (-1)^{[i][j]+[i]}T_{ji}(u), \quad (2.8)$$

$$\psi(AB) = (-1)^{\text{grad}(A) \cdot \text{grad}(B)}\psi(B)\psi(A), \quad (2.9)$$

for $A, B \in \mathcal{A}$ of definite gradation. It preserves the supercommutator $\psi([A, B]) = -[\psi(A), \psi(B)]$ and satisfies the composition rule

$$\Delta \circ \psi = (\psi \otimes \psi) \circ \Delta' \quad (2.10)$$

with the standard coproduct (2.7) and the opposite coproduct³

$$\Delta'(T_{ij}(u)) = \sum_k (-1)^{([i]+[k])([k]+[j])} T_{ik}(u) \otimes T_{kj}(u) = \sum_k T_{kj}^{(2)}(u) T_{ik}^{(1)}(u). \quad (2.11)$$

The composition rule (2.10) is the key property for the investigation of dual Bethe vectors in the composite model, as we will see below.

2.2 Notation

The following functions are used throughout the text:

$$f(u, v) = 1 + g(u, v) = \frac{u - v + c}{u - v}, \quad h(u, v) = \frac{f(u, v)}{g(u, v)} = \frac{u - v + c}{c}. \quad (2.12)$$

We completely follow the notation used, e.g., in [18]. The sets of parameters are denoted as \bar{u}, \bar{v} etc. Their individual elements as u_j, v_0 , etc. The notation \bar{u}_j, \bar{v}_0 means $\bar{u} \setminus u_j, \bar{v} \setminus v_0$, etc. To avoid lengthy and complicated formulas, we use the shorthand notation for products of the above functions over the sets of parameters. For example,

$$f(\bar{u}, v) \equiv \prod_{u_j \in \bar{u}} f(u_j, v), \quad g(u, \bar{v}_i) \equiv \prod_{\substack{v_j \in \bar{v} \\ v_j \neq v_i}} g(u, v_j), \quad h(\bar{u}, \bar{v}) = \prod_{u_j \in \bar{u}} \prod_{v_k \in \bar{v}} h(u_j, v_k). \quad (2.13)$$

This notation is preserved also for products of even operators

$$T_{ij}(\bar{u}) \equiv \prod_{u_k \in \bar{u}} T_{ij}(u_k), \quad [i] + [j] = 0. \quad (2.14)$$

For products of odd operators $T_{i3}(u)$ and $T_{3i}(u)$, $i = 1, 2$, the symmetrised product is used

$$\mathbb{T}_{i3}(\bar{u}) \equiv \frac{T_{i3}(u_1)T_{i3}(u_2) \cdots T_{i3}(u_n)}{\prod_{1 \leq j < k \leq n} h(u_k, u_j)}, \quad \mathbb{T}_{3i}(\bar{u}) \equiv \frac{T_{3i}(u_1)T_{3i}(u_2) \cdots T_{3i}(u_n)}{\prod_{1 \leq j < k \leq n} h(u_j, u_k)}. \quad (2.15)$$

³ The name *opposite coproduct* is obviously relative. It refers to the fact that it intertwines the factors in the tensor product in comparison with the "standard" coproduct (2.7). In the same way, (2.7) is the opposite coproduct to (2.11). Despite this, we call in this article the coproduct of the type (2.7) the *standard* and of (2.11) the *opposite*.

A set of parameters \bar{u} is often divided into its two disjoint subsets \bar{u}_I, \bar{u}_{II} : $\bar{u}_I \cap \bar{u}_{II} = \emptyset$ and $\bar{u}_I \cup \bar{u}_{II} = \bar{u}$. We denote it as $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$. Such a partition is always accompanied by a summation over all partitions of the prescribed type, just according to the rule: *"where a partition is, there is a summation."*

2.3 Bethe vectors

The Bethe vectors for the $\mathfrak{gl}(2|1)$ -invariant models were calculated in [18]. They are obtained under the assumption that there is a cyclic vector Ω which is an eigenvector of the diagonal elements of the monodromy matrix $T(u)$ and is annihilated by the lower-triangular elements:

$$T_{ii}(u)\Omega = \lambda_i(u)\Omega, \quad T_{ij}(u)\Omega = 0, \quad i > j. \quad (2.16)$$

The eigenfunctions $\lambda_i(u)$ vary depending on the model. Leaving them as arbitrary functions of the parameter u , the model is called generalized. The cyclic vector Ω is called pseudovacuum. We suppose its gradation to be vanishing (Ω is an even supervector). The other Bethe vectors $\mathbb{B}_{a,b}(\bar{u}; \bar{v})$ are generated by the action of the upper-triangular elements $T_{ij}(u)$, $i < j$, on Ω . They depend on two sets of spectral parameters $\bar{u} = \{u_1, \dots, u_a\}$ and $\bar{v} = \{v_1, \dots, v_b\}$ where $a, b = 0, 1, 2, \dots$ are the cardinalities $a = \#\bar{u}$ and $b = \#\bar{v}$.

The Bethe vectors have several representations [18]. It is convenient to use the following one for our purposes:

$$\mathbb{B}_{a,b}(\bar{u}; \bar{v}) = \sum K_n(\bar{v}_I | \bar{u}_I) \frac{f(\bar{u}_I, \bar{u}_{II})g(\bar{v}_{II}, \bar{v}_I)}{\lambda_2(\bar{u}_{II})\lambda_2(\bar{v})f(\bar{v}, \bar{u})} \mathbb{T}_{13}(\bar{v}_I) \mathbb{T}_{23}(\bar{v}_{II}) T_{12}(\bar{u}_{II}) \Omega. \quad (2.17)$$

The sum goes over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$ with the restriction that $\#\bar{u}_I = \#\bar{v}_I = n$, where $n = 0, 1, \dots, \min(a, b)$. The function $K_n(\bar{v}_I | \bar{u}_I)$ is the partition function of the six-vertex model with the domain wall boundary condition [13]. It has the following representation [9]:

$$K_n(\bar{v} | \bar{u}) = \prod_{i < j}^n g(v_i, v_j) g(u_j, u_i) \cdot \frac{f(\bar{v}, \bar{u})}{g(\bar{v}, \bar{u})} \det \left[\frac{g^2(v_k, u_l)}{f(v_k, u_l)} \right] \Big|_{k,l=1, \dots, n}. \quad (2.18)$$

A simple observation states that the Bethe vector $\mathbb{B}_{a,b}(\bar{u}; \bar{v})$ has the gradation $\text{grad}(\mathbb{B}_{a,b}) = b \pmod{2}$.

Similarly, we assume the existence of the dual pseudovacuum Ω^\dagger with the properties

$$\Omega^\dagger T_{ii}(u) = \lambda_i(u)\Omega^\dagger, \quad \Omega^\dagger T_{ij}(u) = 0, \quad i > j, \quad (2.19)$$

where the eigenfunctions $\lambda_i(u)$ are the same as in (2.16). We suppose the gradation of Ω^\dagger to be vanishing. The dual Bethe vectors $\mathbb{C}_{ab}(\bar{u}; \bar{v})$ also depend on two sets of spectral parameters \bar{u}, \bar{v} with $a = \#\bar{u}$, $b = \#\bar{v}$. Their explicit form is [18]

$$\mathbb{C}_{a,b}(\bar{u}; \bar{v}) = (-1)^{\frac{b^2-b}{2}} \sum K_n(\bar{v}_I | \bar{u}_I) \frac{f(\bar{u}_I, \bar{u}_{II})g(\bar{v}_{II}, \bar{v}_I)}{\lambda_2(\bar{u}_{II})\lambda_2(\bar{v})f(\bar{v}, \bar{u})} \Omega^\dagger T_{21}(\bar{u}_{II}) \mathbb{T}_{32}(\bar{v}_{II}) \mathbb{T}_{31}(\bar{v}_I), \quad (2.20)$$

where the sum goes over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$ with the restriction that $\#\bar{u}_I = \#\bar{v}_I = n$, where $n = 0, 1, \dots, \min(a, b)$. The gradation of the dual Bethe vector $\mathbb{C}_{a,b}(\bar{u}; \bar{v})$ is again $\text{grad}(\mathbb{C}_{a,b}) = b \pmod{2}$.

If the antimorphism (2.8) relates the pseudovacuum to the dual pseudovacuum as $\psi(\Omega) = \Omega^\dagger$, the Bethe vector $\mathbb{B}_{a,b}(\bar{u}; \bar{v})$ is mapped by ψ to the dual Bethe vector $\mathbb{C}_{a,b}(\bar{u}; \bar{v})$

$$\psi(\mathbb{B}_{a,b}(\bar{u}; \bar{v})) = \mathbb{C}_{a,b}(\bar{u}; \bar{v}). \quad (2.21)$$

3 Composite $\mathfrak{gl}(2|1)$ -invariant model

The interval $[0, L]$, which the generalized model is defined on, is split into its two subintervals, as discussed in the introduction. The fact that the monodromy matrix of the full model $T(u)$ is simply the matrix product of the partial monodromy matrices $T^{(2)}(u)T^{(1)}(u)$, as expressed in (1.1), follows from the coproduct (2.7) in the bialgebra \mathcal{A} .

This is followed by the split of the original superspace into its two graded subspaces $\mathcal{H} = \mathcal{H}^{(1)} \otimes \mathcal{H}^{(2)}$. We suppose that the graded subspaces $\mathcal{H}^{(\ell)}$, $\ell = 1, 2$, contain the partial pseudovacua $\Omega^{(\ell)}$ with the properties

$$T_{ii}^{(\ell)}(u)\Omega^{(\ell)} = \lambda_i^{(\ell)}(u)\Omega^{(\ell)}, \quad T_{ij}^{(\ell)}(u)\Omega^{(\ell)} = 0, \quad i < j. \quad (3.1)$$

The operators $T_{ij}^{(\ell)}(u)$ are the matrix elements of the partial monodromy matrices $T^{(\ell)}(u)$ described by (1.1). In other words, the subspaces $\mathcal{H}^{(\ell)}$ have exactly the same structure of a Fock space as the full superspace \mathcal{H} . The corresponding Bethe vectors are denoted as $\mathbb{B}_{a,b}^{(\ell)}(\bar{u}; \bar{v})$. We suppose that the partial pseudovacua $\Omega^{(\ell)}$ form the total pseudovacuum $\Omega = \Omega^{(1)}\Omega^{(2)}$. We omit here the symbol \otimes for the direct product of the pseudovacua because the superscripts at $\Omega^{(\ell)}$ indicate that we work in the direct product of superspaces. This notation is kept also below for direct products of arbitrary Bethe vectors.

Similarly, we suppose for the partial dual superspaces the existence of the dual pseudovacua $\Omega^{\dagger(\ell)}$ satisfying

$$\Omega^{\dagger(\ell)}T_{ii}^{(\ell)}(u) = \lambda_i^{(\ell)}(u)\Omega^{\dagger(\ell)}, \quad \Omega^{\dagger(\ell)}T_{ij}^{(\ell)}(u) = 0, \quad i > j. \quad (3.2)$$

The corresponding dual Bethe vectors are denoted as $\mathbb{C}_{a,b}^{(\ell)}(\bar{u}; \bar{v})$ and we again suppose that $\Omega^\dagger = \Omega^{\dagger(1)}\Omega^{\dagger(2)}$.

It is useful to introduce two ratio functions $r_1(u)$ and $r_3(u)$ instead of three independent functions $\lambda_i(u)$:

$$r_i(u) = \frac{\lambda_i(u)}{\lambda_2(u)}, \quad i = 1, 3, \quad r_i^{(\ell)}(u) = \frac{\lambda_i^{(\ell)}(u)}{\lambda_2^{(\ell)}(u)}, \quad i = 1, 3; \ell = 1, 2. \quad (3.3)$$

This corresponds to the multiplication of the monodromy matrix by $\lambda_2^{-1}(u)$. Obviously $\lambda_i(u) = \lambda_i^{(1)}(u)\lambda_i^{(2)}(u)$ and $r_i(u) = r_i^{(1)}(u)r_i^{(2)}(u)$.

3.1 Main results

Theorem 1. *The Bethe vectors of the full model can be expressed as the bilinear combination of the partial Bethe vectors:*

$$\mathbb{B}_{a,b}(\bar{u}; \bar{v}) = \sum r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I) g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_{II}, \bar{u}_I)} \mathbb{B}_{a_2, b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II}) \mathbb{B}_{a_1, b_1}^{(1)}(\bar{u}_I; \bar{v}_I). \quad (3.4)$$

The summation goes over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$ with no restriction. The corresponding cardinalities satisfy $a_1 + a_2 = a$ and $b_1 + b_2 = b$.

The coproduct used in the proof is the standard one (2.7), as can be seen in section 4.

Idea of the proof. The proof is based on a recursion relation enjoined by Bethe vectors of $\mathfrak{gl}(2|1)$ -invariant models [18]

$$\begin{aligned} \frac{T_{23}(z)}{\lambda_2(z)h(\bar{v}, z)} \mathbb{B}_{a, b-1}(\bar{u}; \bar{v}) &= f(z, \bar{u}) \mathbb{B}_{a, b}(\bar{u}; \{z, \bar{v}\}) \\ &+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} g(u_0, z) f(u_0, \bar{u}_0) \frac{T_{13}(z) \mathbb{B}_{a-1, b-1}(\bar{u}_0; \bar{v})}{\lambda_2(z)h(\bar{v}, z)}. \end{aligned} \quad (3.5)$$

Here the sum is taken over all partitions $\bar{u} \Rightarrow \{u_0, \bar{u}_0\}$ where $\#u_0 = 1$.

Let us define the following vectors contained in the composite model, i.e., in $\mathcal{H}^{(1)} \otimes \mathcal{H}^{(2)}$:

$$\mathcal{B}_{a,b}(\bar{u}; \bar{v}) = \sum r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I) g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_{II}, \bar{u}_I)} \mathbb{B}^{(2)}(\bar{u}_{II}; \bar{v}_{II}) \mathbb{B}^{(1)}(\bar{u}_I; \bar{v}_I). \quad (3.6)$$

The subscripts a_1, b_1, a_2, b_2 of the partial Bethe vectors $\mathbb{B}^{(1)}(\bar{u}_I; \bar{v}_I)$ and $\mathbb{B}^{(2)}(\bar{u}_{II}; \bar{v}_{II})$ in the definition of $\mathcal{B}_{a,b}(\bar{u}; \bar{v})$ are omitted here and below because they do not carry any important information. Obviously, if we prove that vector (3.6) satisfies recursion (3.5) and an initial condition $\mathcal{B}_{a,0}(\bar{u}; \emptyset) = \mathbb{B}_{a,0}(\bar{u}; \emptyset)$, $a = 0, 1, \dots$, then using induction over b we immediately obtain that $\mathcal{B}_{a,b}(\bar{u}; \bar{v}) = \mathbb{B}_{a,b}(\bar{u}; \bar{v})$ for a and b arbitrary.

It is easy to see that $\mathcal{B}_{a,0}(\bar{u}; \emptyset)$ coincides with the known result for the composite $\mathfrak{gl}(2)$ -invariant model [10]

$$\mathcal{B}_{a,0}(\bar{u}; \emptyset) = \sum r_1^{(2)}(\bar{u}_I) f(\bar{u}_{II}, \bar{u}_I) \mathbb{B}^{(2)}(\bar{u}_{II}; \emptyset) \mathbb{B}^{(1)}(\bar{u}_I; \emptyset) = \mathbb{B}_{a,0}(\bar{u}; \emptyset). \quad (3.7)$$

Thus, the initial condition is satisfied. It remains to prove that $\mathcal{B}_{a,b}(\bar{u}; \bar{v})$ satisfies the recursion

$$\begin{aligned} \frac{T_{23}(z)}{\lambda_2(z)h(\bar{v}, z)} \mathcal{B}_{a, b-1}(\bar{u}; \bar{v}) &= f(z, \bar{u}) \mathcal{B}_{a, b}(\bar{u}; \{z, \bar{v}\}) \\ &+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} g(u_0, z) f(u_0, \bar{u}_0) \frac{T_{13}(z) \mathcal{B}_{a-1, b-1}(\bar{u}_0; \bar{v})}{\lambda_2(z)h(\bar{v}, z)}. \end{aligned} \quad (3.8)$$

Here the notation is the same as in (3.5).

One can easily convince oneself that recursion relation (3.8) is a simple consequence of the following two relations which we intend to prove in section 4:

$$\frac{T_{13}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathcal{B}_{a-1,b-1}(\bar{u}; \bar{v}) = \mathcal{B}_{a,b}(\{z, \bar{u}\}; \{z, \bar{v}\}), \quad (3.9)$$

$$\begin{aligned} \frac{T_{23}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathcal{B}_{a,b-1}(\bar{u}; \bar{v}) &= f(z, \bar{u})\mathcal{B}_{a,b}(\bar{u}; \{z, \bar{v}\}) \\ &+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} g(u_0, z)f(u_0, \bar{u}_0)\mathcal{B}_{a,b}(\{z, \bar{u}_0\}; \{z, \bar{v}\}). \end{aligned} \quad (3.10)$$

The sum is performed here over all partitions of the type $\bar{u} \Rightarrow \{u_0, \bar{u}_0\}$ where $\#u_0 = 1$. Thus, the proof of equations (3.9), (3.10) yields the proof of (3.4). \square

Remark. We can commute the factors $\mathbb{B}_{a_1,b_1}^{(1)}(\bar{u}_I; \bar{v}_I)$ and $\mathbb{B}_{a_2,b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II})$ in (3.4) according to

$$g(\bar{v}_I, \bar{v}_{II})\mathbb{B}_{a_2,b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II})\mathbb{B}_{a_1,b_1}^{(1)}(\bar{u}_I; \bar{v}_I) = g(\bar{v}_{II}, \bar{v}_I)\mathbb{B}_{a_1,b_1}^{(1)}(\bar{u}_I; \bar{v}_I)\mathbb{B}_{a_2,b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II}) \quad (3.11)$$

because their gradation is reflected in the product of the antisymmetric functions $g(\bar{v}_I, \bar{v}_{II})$.

Theorem 2. *The dual Bethe vectors of the full model can be expressed as the bilinear combination of the partial dual Bethe vectors:*

$$\mathbb{C}_{a,b}(\bar{u}; \bar{v}) = \sum r_1^{(1)}(\bar{u}_{II})r_3^{(2)}(\bar{v}_I) \frac{f(\bar{u}_I, \bar{u}_{II})g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_I, \bar{u}_I)} \mathbb{C}_{a_1,b_1}^{(1)}(\bar{u}_I; \bar{v}_I) \mathbb{C}_{a_2,b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II}). \quad (3.12)$$

The summation goes over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$. The corresponding cardinalities satisfy $a_1 + a_2 = a$ and $b_1 + b_2 = b$.

Proof. The Bethe vector $\mathbb{B}_{a,b}(\bar{u}; \bar{v})$ can be understood as

$$\mathbb{B}_{a,b}(\bar{u}; \bar{v}) = B_{a,b}(\bar{u}; \bar{v})\Omega \quad (3.13)$$

where $B_{a,b}(\bar{u}; \bar{v})$ is the polynomial in the elements of the bialgebra \mathcal{A} which acts on the pseudovacuum Ω . In other words, it is the rest of the Bethe vector (2.17) if we erase the pseudovacuum. Hence formula (3.4) for Bethe vectors in the composite model can be written as

$$\begin{aligned} \mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= B_{a,b}(\bar{u}; \bar{v})\Omega = \Delta(B_{a,b}(\bar{u}; \bar{v}))\Omega^{(1)}\Omega^{(2)} \\ &= \sum r_1^{(2)}(\bar{u}_I)r_3^{(1)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I)g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_{II}, \bar{u}_I)} B_{a_2,b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II})B_{a_1,b_1}^{(1)}(\bar{u}_I; \bar{v}_I)\Omega^{(1)}\Omega^{(2)}. \end{aligned} \quad (3.14)$$

The antimorphism (2.8) relates the Bethe vectors to the dual Bethe vectors, cf. (2.21),

$$\mathbb{C}_{a,b}(\bar{u}; \bar{v}) = \psi(\mathbb{B}_{a,b}(\bar{u}; \bar{v})) = \psi(\Omega)\psi(B_{a,b}(\bar{u}; \bar{v})) = \Omega^\dagger\psi(B_{a,b}(\bar{u}; \bar{v})).$$

Due to the composition rule (2.10) for the antimorphism ψ with the coproducts (2.7) and (2.11), we obtain for the composite model

$$\begin{aligned} \mathbb{C}_{a,b}(\bar{u}; \bar{v}) &= \Omega^{\dagger(1)}\Omega^{\dagger(2)}[\Delta \circ \psi(B_{a,b}(\bar{u}; \bar{v}))] = \Omega^{\dagger(1)}\Omega^{\dagger(2)}[(\psi \otimes \psi) \circ \Delta'(B_{a,b}(\bar{u}; \bar{v}))] \\ &= \Omega^{\dagger(1)}\Omega^{\dagger(2)}\left[(\psi \otimes \psi) \sum r_1^{(1)}(\bar{u}_I)r_3^{(2)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I)g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_{II}, \bar{u}_I)} B_{a_2,b_2}^{(1)}(\bar{u}_{II}; \bar{v}_{II})B_{a_1,b_1}^{(2)}(\bar{u}_I; \bar{v}_I)\right]. \end{aligned}$$

We stress that the factors $B_{a_2, b_2}^{(2)}(\bar{u}_\Pi; \bar{v}_\Pi) B_{a_1, b_1}^{(1)}(\bar{u}_I; \bar{v}_I)$ are changed to $B_{a_2, b_2}^{(1)}(\bar{u}_\Pi; \bar{v}_\Pi) B_{a_1, b_1}^{(2)}(\bar{u}_I; \bar{v}_I)$ in comparison with theorem 1. In the same way, the functions $r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_\Pi)$ are changed to $r_1^{(1)}(\bar{u}_I) r_3^{(2)}(\bar{v}_\Pi)$. This is due to the use of the opposite coproduct (2.11) instead of the standard one (2.7). After application of $\psi \otimes \psi$

$$\mathbb{C}_{a,b}(\bar{u}; \bar{v}) = \sum r_1^{(1)}(\bar{u}_I) r_3^{(2)}(\bar{v}_\Pi) \frac{f(\bar{u}_\Pi, \bar{u}_I) g(\bar{v}_I, \bar{v}_\Pi)}{f(\bar{v}_\Pi, \bar{u}_I)} \mathbb{C}_{a_2, b_2}^{(1)}(\bar{u}_\Pi; \bar{v}_\Pi) \mathbb{C}_{a_1, b_1}^{(2)}(\bar{u}_I; \bar{v}_I). \quad (3.15)$$

Renaming the sets of variables as $\bar{u}_I \leftrightarrow \bar{u}_\Pi$, $\bar{v}_I \leftrightarrow \bar{v}_\Pi$, we arrive at the statement of the theorem. \square

4 Action of $T_{13}(z)$ and $T_{23}(z)$ on $\mathcal{B}_{a,b}(\bar{u}; \bar{v})$

We aim to prove that the supervectors (3.6) satisfy

$$\frac{T_{13}(z)}{\lambda_2(z) h(\bar{v}, z)} \mathcal{B}_{a-1, b-1}(\bar{u}; \bar{v}) = \mathcal{B}_{a,b}(\bar{\eta}; \bar{\xi}) \quad (4.1)$$

where we introduce new sets of spectral parameters $\bar{\eta} = \{z, \bar{u}\}$ and $\bar{\xi} = \{z, \bar{v}\}$. Equation (4.1) is just one of the properties satisfied by the Bethe vector $\mathbb{B}_{a-1, b-1}(\bar{u}; \bar{v})$, as remarked in appendix A. The strategy of the proof is simple. We investigate both sides of (4.1) separately and then show that they coincide. To this end, we use the known formulas for the action of the monodromy matrix elements on the Bethe vectors listed in appendix A.

The right-hand side of (4.1) has the form

$$\mathcal{B}_{a,b}(\bar{\eta}; \bar{\xi}) = \sum r_1^{(2)}(\bar{\eta}_I) r_3^{(1)}(\bar{\xi}_\Pi) \frac{f(\bar{\eta}_\Pi, \bar{\eta}_I) g(\bar{\xi}_I, \bar{\xi}_\Pi)}{f(\bar{\xi}_\Pi, \bar{\eta}_I)} \mathbb{B}^{(2)}(\bar{\eta}_\Pi; \bar{\xi}_\Pi) \mathbb{B}^{(1)}(\bar{\eta}_I; \bar{\xi}_I) \quad (4.2)$$

where we just used definition (3.6). From the analysis how the parameter z can enter the subsets $\bar{\eta}_I, \bar{\xi}_I, \bar{\eta}_\Pi, \bar{\xi}_\Pi$ we obtain three cases:

$$\begin{array}{llll} (i) & \bar{\eta}_I = \{z, \bar{u}_I\}, & \bar{\xi}_I = \{z, \bar{v}_I\}, & \bar{\eta}_\Pi = \bar{u}_\Pi, \quad \bar{\xi}_\Pi = \bar{v}_\Pi, \\ (ii) & \bar{\eta}_I = \bar{u}_I, & \bar{\xi}_I = \bar{v}_I, & \bar{\eta}_\Pi = \{z, \bar{u}_\Pi\}, \quad \bar{\xi}_\Pi = \{z, \bar{v}_\Pi\}, \\ (iii) & \bar{\eta}_I = \bar{u}_I, & \bar{\xi}_I = \{z, \bar{v}_I\}, & \bar{\eta}_\Pi = \{z, \bar{u}_\Pi\}, \quad \bar{\xi}_\Pi = \bar{v}_\Pi. \end{array}$$

The case, where $z \in \bar{\xi}_\Pi$ and $z \in \bar{\eta}_I$, gives a vanishing contribution because of the function $f(\bar{\xi}_\Pi, \bar{\eta}_I)$ in the denominator. The vector $\mathcal{B}_{a,b}(\bar{\eta}; \bar{\xi})$ is thus composed of three parts with different structure

$$\mathcal{B}_{a,b}(\bar{\eta}; \bar{\xi}) = A_1 + A_2 + A_3 \quad (4.3)$$

where

$$\begin{aligned} A_1 = \sum r_1^{(2)}(z) r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_\Pi) & \frac{f(\bar{u}_\Pi, z) f(\bar{u}_\Pi, \bar{u}_I) g(\bar{v}_I, \bar{v}_\Pi) g(z, \bar{v}_\Pi)}{f(\bar{v}_\Pi, \bar{u}_I) f(\bar{v}_\Pi, z)} \\ & \times \mathbb{B}^{(2)}(\bar{u}_\Pi; \bar{v}_\Pi) \mathbb{B}^{(1)}(\{z, \bar{u}_I\}; \{z, \bar{v}_I\}), \end{aligned} \quad (4.4)$$

$$A_2 = \sum r_1^{(2)}(\bar{u}_I) r_3^{(1)}(z) r_3^{(1)}(\bar{v}_\Pi) \frac{f(\bar{u}_\Pi, \bar{u}_I) g(\bar{v}_I, z) g(\bar{v}_I, \bar{v}_\Pi)}{f(\bar{v}_\Pi, \bar{u}_I)} \mathbb{B}^{(2)}(\{z, \bar{u}_\Pi\}; \{z, \bar{v}_\Pi\}) \mathbb{B}^{(1)}(\bar{u}_I; \bar{v}_I), \quad (4.5)$$

$$A_3 = \sum r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_\Pi) \frac{f(z, \bar{u}_I) f(\bar{u}_\Pi, \bar{u}_I) g(z, \bar{v}_\Pi) g(\bar{v}_I, \bar{v}_\Pi)}{f(\bar{v}_\Pi, \bar{u}_I)} \mathbb{B}^{(2)}(\{z, \bar{u}_\Pi\}; \bar{v}_\Pi) \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_I\}). \quad (4.6)$$

As the supervector $\mathcal{B}_{a-1, b-1}(\bar{u}; \bar{v})$ belongs to $\mathcal{H}^{(1)} \otimes \mathcal{H}^{(2)}$, the action of $T_{13}(z)$ on it is defined via a coproduct. We use the standard one (2.7)

$$\Delta(T_{13}(z)) = T_{13}^{(1)}(z) T_{11}^{(2)}(z) + T_{23}^{(1)}(z) T_{12}^{(2)}(z) + T_{33}^{(1)}(z) T_{13}^{(2)}(z). \quad (4.7)$$

Hence, the left-hand side of (4.1) decomposes into three parts

$$\begin{aligned} \frac{T_{13}(z)}{\lambda_2(z) h(\bar{v}, z)} \mathcal{B}_{a-1, b-1}(\bar{u}; \bar{v}) &= C_1 + C_2 + C_3 \\ &= \left(\frac{T_{13}^{(1)}(z) T_{11}^{(2)}(z)}{\lambda_2(z) h(\bar{v}, z)} + \frac{T_{23}^{(1)}(z) T_{12}^{(2)}(z)}{\lambda_2(z) h(\bar{v}, z)} + \frac{T_{33}^{(1)}(z) T_{13}^{(2)}(z)}{\lambda_2(z) h(\bar{v}, z)} \right) \mathcal{B}_{a-1, b-1}(\bar{u}; \bar{v}). \end{aligned} \quad (4.8)$$

The specific parts C_k , $k = 1, 2, 3$, can be written as

$$\begin{aligned} C_k &= \sum (-1)^{(1+[k]) \cdot b_2} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_\Pi) \frac{f(\bar{u}_\Pi, \bar{u}_I) g(\bar{v}_I, \bar{v}_\Pi)}{f(\bar{v}_\Pi, \bar{u}_I)} \\ &\quad \times \frac{T_{1k}^{(2)}(z)}{\lambda_2^{(2)}(z) h(\bar{v}_\Pi, z)} \mathbb{B}^{(2)}(\bar{u}_\Pi; \bar{v}_\Pi) \frac{T_{k3}^{(1)}(z)}{\lambda_2^{(1)}(z) h(\bar{v}_I, z)} \mathbb{B}^{(1)}(\bar{u}_I; \bar{v}_I) \end{aligned} \quad (4.9)$$

where $b_2 = \#\bar{v}_\Pi$. The sign factor in C_k appears because of the oddness of the monodromy matrix element $T_{i3}(z)$, $i = 1, 2$. It is absorbed during the calculations by the antisymmetric functions $g(u, v)$.

Using formulas for the action of the monodromy matrix elements on the Bethe vectors listed in appendix A, we obtain the explicit forms of C_k .

$$\begin{aligned} C_1 &= \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_\Pi\} \\ \bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_\Pi\}}} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_\Pi) \frac{f(\bar{u}_\Pi, \bar{u}_I) g(\bar{v}_I, \bar{v}_\Pi)}{f(\bar{v}_\Pi, \bar{u}_I)} \left\{ r_1^{(2)}(z) \frac{f(\bar{u}_\Pi, z) g(z, \bar{v}_\Pi)}{f(\bar{v}_\Pi, z)} \mathbb{B}^{(2)}(\bar{u}_\Pi; \bar{v}_\Pi) \right. \\ &\quad + \sum_{\bar{u}_\Pi \Rightarrow \{u_i, \bar{u}_{ii}\}} r_1^{(2)}(u_i) \frac{f(\bar{u}_{ii}, u_i) g(z, u_i) g(z, \bar{v}_\Pi)}{f(\bar{v}_\Pi, u_i)} \mathbb{B}^{(2)}(\{z, \bar{u}_{ii}\}; \bar{v}_\Pi) \\ &\quad \left. + \sum_{\substack{\bar{u}_\Pi \Rightarrow \{u_i, \bar{u}_{ii}\} \\ \bar{v}_\Pi \Rightarrow \{v_i, \bar{v}_{ii}\}}} r_1^{(2)}(u_i) \frac{f(\bar{u}_{ii}, u_i) g(v_i, z) g(v_i, \bar{v}_{ii})}{f(\bar{v}_{ii}, u_i) h(v_i, z) h(v_i, u_i)} \mathbb{B}^{(2)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_{ii}\}) \right\} \mathbb{B}^{(1)}(\{z, \bar{u}_I\}; \{z, \bar{v}_I\}). \end{aligned} \quad (4.10)$$

$$\begin{aligned}
C_2 = & \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\} \\ \bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}}} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I) g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_{II}, \bar{u}_I)} \\
& \times \left\{ g(z, \bar{v}_{II}) \mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \bar{v}_{II}) + \sum_{\bar{v}_{II} \Rightarrow \{v_i, \bar{v}_{ii}\}} \frac{g(v_i, z) g(v_i, \bar{v}_{ii})}{h(v_i, z)} \mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \{z, \bar{v}_{ii}\}) \right\} \\
& \times \left\{ f(z, \bar{u}_I) \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_I\}) + \sum_{\bar{u}_I \Rightarrow \{u_i, \bar{u}_{ii}\}} g(u_i, z) f(u_i, \bar{u}_{ii}) \mathbb{B}^{(1)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_I\}) \right\}. \quad (4.11)
\end{aligned}$$

$$\begin{aligned}
C_3 = & \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\} \\ \bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}}} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I) g(\bar{v}_I, \bar{v}_{II})}{f(\bar{v}_{II}, \bar{u}_I)} \mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \{z, \bar{v}_{II}\}) \\
& \times \left\{ r_3^{(1)}(z) g(\bar{v}_I, z) \mathbb{B}^{(1)}(\bar{u}_I; \bar{v}_I) + \sum_{\bar{v}_I \Rightarrow \{v_i, \bar{v}_{ii}\}} r_3^{(1)}(v_i) \frac{f(z, \bar{u}_I) g(z, v_i) g(\bar{v}_{ii}, v_i)}{h(v_i, z) f(v_i, \bar{u}_I)} \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_{ii}\}) \right. \\
& \left. + \sum_{\substack{\bar{u}_I \Rightarrow \{u_i, \bar{u}_{ii}\} \\ \bar{v}_I \Rightarrow \{v_i, \bar{v}_{ii}\}}} r_3^{(1)}(v_i) \frac{g(u_i, z) f(u_i, \bar{u}_{ii}) g(z, v_i) g(\bar{v}_{ii}, v_i)}{h(v_i, u_i) f(v_i, z) f(v_i, \bar{u}_{ii})} \mathbb{B}^{(1)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_{ii}\}) \right\}. \quad (4.12)
\end{aligned}$$

The summations are performed over all possible partitions of the sets \bar{u}, \bar{v} of the original Bethe parameters into their subsets $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}, \bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$. Some of these subsets are divided into additional subsets, e.g., $\bar{u}_{II} \Rightarrow \{u_i, \bar{u}_{ii}\}$ where $\#u_i = 1$, and the summation is performed again over all such partitions. The same for the other additional divisions of $\bar{v}_{II}, \bar{u}_I, \bar{v}_I$.

We can moreover see that the sum over partitions in C_1 involving the product of Bethe vectors $\mathbb{B}^{(2)}(\bar{u}_{II}; \bar{v}_{II}) \mathbb{B}^{(1)}(\{z, \bar{u}_I\}; \{z, \bar{v}_I\})$ coincides with the term A_1 . The sum over partitions involving $\mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \bar{v}_{II}) \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_I\})$ in C_2 coincides with A_3 . Similarly, the sum over partitions in C_3 containing $\mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \{z, \bar{v}_{II}\}) \mathbb{B}^{(1)}(\bar{u}_I; \bar{v}_I)$ coincides with A_2 . The remaining terms of C_1, C_2, C_3 cancel mutually, as we show below.

There are two remaining terms containing the product of Bethe vectors of this type

$$\mathbb{B}^{(2)}(\{z, \bar{u}'\}; \{z, \bar{v}'\}) \mathbb{B}^{(1)}(\bar{u}''; \{z, \bar{v}''\}), \quad (4.13)$$

where primes mean any subset of \bar{u} or \bar{v} . Namely, the first term comes from C_2

$$\begin{aligned}
C_{2,3} = & \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\} \\ \bar{v} \Rightarrow \{\bar{v}_I, v_i, \bar{v}_{ii}\}}} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(v_i) r_3^{(1)}(\bar{v}_{ii}) \frac{f(\bar{u}_{II}, \bar{u}_I) g(\bar{v}_I, \bar{v}_{ii}) g(\bar{v}_I, v_i) g(v_i, \bar{v}_{ii}) f(z, \bar{u}_I)}{f(\bar{v}_{ii}, \bar{u}_I) f(v_i, \bar{u}_I) h(v_i, z)} \\
& \times g(v_i, z) \mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \{z, \bar{v}_{ii}\}) \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_I\}) \quad (4.14)
\end{aligned}$$

and the second term from C_3

$$\begin{aligned}
C_{3,2} = & \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\} \\ \bar{v} \Rightarrow \{v_i, \bar{v}_{ii}, \bar{v}_{II}\}}} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(v_i) r_3^{(1)}(\bar{v}_{II}) \frac{f(\bar{u}_{II}, \bar{u}_I) g(\bar{v}_{ii}, \bar{v}_{II}) g(v_i, \bar{v}_{II}) g(\bar{v}_{ii}, v_i) f(z, \bar{u}_I)}{f(\bar{v}_{II}, \bar{u}_I) f(v_i, \bar{u}_I) h(v_i, z)} \\
& \times g(z, v_i) \mathbb{B}^{(2)}(\{z, \bar{u}_{II}\}; \{z, \bar{v}_{II}\}) \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_{ii}\}). \quad (4.15)
\end{aligned}$$

Renaming the sets $\bar{v}_\Pi \rightarrow \bar{v}_{ii}$ and $\bar{v}_i \rightarrow \bar{v}_I$ in (4.15), we obtain

$$C_{3,2} = \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{ii}\} \\ \bar{v} \Rightarrow \{v_i, \bar{v}_I, \bar{v}_{ii}\}}} r_1^{(2)}(\bar{u}_I) r_3^{(1)}(v_i) r_3^{(1)}(\bar{v}_{ii}) \frac{f(\bar{u}_\Pi, \bar{u}_I) g(\bar{v}_I, \bar{v}_{ii}) g(v_i, \bar{v}_{ii}) g(\bar{v}_I, v_i) f(z, \bar{u}_I)}{f(\bar{v}_{ii}, \bar{u}_I) f(v_i, \bar{u}_I) h(v_i, z)} \\ \times g(z, v_i) \mathbb{B}^{(2)}(\{z, \bar{u}_\Pi\}; \{z, \bar{v}_{ii}\}) \mathbb{B}^{(1)}(\bar{u}_I; \{z, \bar{v}_I\}). \quad (4.16)$$

Due to the antisymmetry of the function $g(z, v_i)$, we see that $C_{2,3} + C_{3,2} = 0$.

There are two terms containing the product of Bethe vectors of the type

$$\mathbb{B}^{(2)}(\{z, \bar{u}'\}; \bar{v}') \mathbb{B}^{(1)}(\{z, \bar{u}''\}; \{z, \bar{v}''\}). \quad (4.17)$$

One such term is contained in C_1 and one in C_2 . One can prove that their sum vanishes by similar argumentation as above.

The remaining three terms contain Bethe vectors of the type

$$\mathbb{B}^{(2)}(\{z, \bar{u}'\}; \{z, \bar{v}'\}) \mathbb{B}^{(1)}(\{z, \bar{u}''\}; \{z, \bar{v}''\}). \quad (4.18)$$

They are the following:

$$C_{1,3} = \sum_{\substack{\bar{u} \Rightarrow \{\bar{u}_I, u_i, \bar{u}_{ii}\} \\ \bar{v} \Rightarrow \{\bar{v}_I, v_i, \bar{v}_{ii}\}}} r_1^{(2)}(\bar{u}_I) r_1^{(2)}(u_i) r_3^{(1)}(\bar{v}_{ii}) r_3^{(1)}(v_i) \frac{f(u_i, \bar{u}_I) f(\bar{u}_{ii}, \bar{u}_I) f(\bar{u}_{ii}, u_i)}{f(\bar{v}_{ii}, \bar{u}_I) f(v_i, \bar{u}_I) f(\bar{v}_{ii}, u_i) f(v_i, u_i)} \\ \times \frac{g(\bar{v}_I, \bar{v}_{ii}) g(\bar{v}_I, v_i) g(v_i, \bar{v}_{ii})}{h(v_i, z)} g(v_i, z) g(v_i, u_i) \mathbb{B}^{(2)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_{ii}\}) \mathbb{B}^{(1)}(\{z, \bar{u}_I\}; \{z, \bar{v}_I\}), \quad (4.19)$$

$$C_{2,4} = \sum_{\substack{\bar{u} \Rightarrow \{u_i, \bar{u}_{ii}, \bar{u}_{ii}\} \\ \bar{v} \Rightarrow \{\bar{v}_I, v_i, \bar{v}_{ii}\}}} r_1^{(2)}(\bar{u}_{ii}) r_1^{(2)}(u_i) r_3^{(1)}(\bar{v}_{ii}) r_3^{(1)}(v_i) \frac{f(\bar{u}_\Pi, \bar{u}_{ii}) f(\bar{u}_\Pi, u_i) f(u_i, \bar{u}_{ii})}{f(\bar{v}_{ii}, \bar{u}_{ii}) f(\bar{v}_{ii}, u_i) f(v_i, \bar{u}_{ii}) f(v_i, u_i)} \\ \times \frac{g(\bar{v}_I, \bar{v}_{ii}) g(\bar{v}_I, v_i) g(v_i, \bar{v}_{ii})}{h(v_i, z)} g(v_i, z) g(u_i, z) \mathbb{B}^{(2)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_{ii}\}) \mathbb{B}^{(1)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_I\}), \quad (4.20)$$

$$C_{3,3} = \sum_{\substack{\bar{u} \Rightarrow \{u_i, \bar{u}_{ii}, \bar{u}_{ii}\} \\ \bar{v} \Rightarrow \{v_i, \bar{v}_{ii}, \bar{v}_{ii}\}}} r_1^{(2)}(\bar{u}_{ii}) r_1^{(2)}(u_i) r_3^{(1)}(\bar{v}_{ii}) r_3^{(1)}(v_i) \frac{f(\bar{u}_\Pi, \bar{u}_{ii}) f(\bar{u}_\Pi, u_i) f(u_i, \bar{u}_{ii})}{f(\bar{v}_{ii}, \bar{u}_{ii}) f(\bar{v}_{ii}, u_i) f(v_i, \bar{u}_{ii}) f(v_i, u_i)} \\ \times \frac{g(\bar{v}_{ii}, \bar{v}_{ii}) g(v_i, \bar{v}_{ii}) g(\bar{v}_{ii}, v_i)}{h(v_i, z)} g(z, u_i) g(v_i, u_i) \mathbb{B}^{(2)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_{ii}\}) \mathbb{B}^{(1)}(\{z, \bar{u}_{ii}\}; \{z, \bar{v}_{ii}\}). \quad (4.21)$$

We rename the sets as $\bar{u}_\Pi \rightarrow \bar{u}_{ii}$ and $\bar{u}_{ii} \rightarrow \bar{u}_I$ in (4.20). In (4.21) we rename the sets as $\bar{u}_\Pi, \bar{v}_\Pi \rightarrow \bar{u}_{ii}, \bar{v}_{ii}$ and $\bar{u}_{ii}, \bar{v}_{ii} \rightarrow \bar{u}_I, \bar{v}_I$. Thus, we obtain all the Bethe vectors in (4.19)–(4.21) with the same arguments. Due to the identity

$$g(v_i, z) g(v_i, u_i) + g(v_i, z) g(u_i, z) + g(z, u_i) g(v_i, u_i) = 0, \quad (4.22)$$

we see that $C_{1,3} + C_{2,4} + C_{3,3} = 0$. Equality (4.1) is thus proved.

The action of $T_{23}(z)$ on $\mathcal{B}_{a,b-1}(\bar{u}; \bar{v})$ described in (3.10) can be proved in a similar manner. We again use the coproduct (2.7) to define the action of $T_{23}(z)$ on the direct product of two partial Bethe vectors $\mathbb{B}_{a_2,b_2}^{(2)}(\bar{u}_{\text{II}}; \bar{v}_{\text{II}})\mathbb{B}_{a_1,b_1}^{(1)}(\bar{u}_{\text{I}}; \bar{v}_{\text{I}})$ and formulas from appendix A for the action of the monodromy matrix elements on Bethe vectors. The case of $T_{23}(z)$ involves more lengthy calculations than that of $T_{13}(z)$. As the reasoning is rather similar, we do not provide the details here.

5 Composite $\mathfrak{gl}(1|2)$ -invariant model

Let us denote the RTT algebra corresponding to $\mathfrak{gl}(1|2)$ as $\tilde{\mathcal{A}}$ and its elements as $\tilde{T}_{ij}(u)$ to distinguish them from their $\mathfrak{gl}(2|1)$ equivalents. The gradation in the $\mathfrak{gl}(1|2)$ case is described by the parity function $\widetilde{[\]}$, where $\widetilde{[1]} = 0$ and $\widetilde{[2]} = \widetilde{[3]} = 1$. The algebraic structure is governed by the bilinear relation (2.6) provided that all relevant objects are marked by tildas.

For the $\mathfrak{gl}(1|2)$ -invariant models the pseudovacuum is denoted as $\tilde{\Omega}$ and the corresponding eigenvalues of $\tilde{T}_{jj}(u)$, $j = 1, 2, 3$, are $\tilde{\lambda}_j(u)$. The dual pseudovacuum is denoted as $\tilde{\Omega}^\dagger$.

There is a relation between gradations on \mathcal{A} and $\tilde{\mathcal{A}}$: $[i] = \widetilde{[4-i]} + 1 \pmod{2}$, $i = 1, 2, 3$.

The superalgebras \mathcal{A} and $\tilde{\mathcal{A}}$ are isomorphic, as was shown in [18]. This is due to the map

$$\varphi : \begin{cases} \mathcal{A} & \rightarrow \tilde{\mathcal{A}}, \\ T_{ij}(u) & \rightarrow (-1)^{[\widetilde{i}][\widetilde{j}] + [\widetilde{j}] + 1} \tilde{T}_{4-j, 4-i}(u), \\ \lambda_j(u) & \rightarrow -\tilde{\lambda}_{4-j}(u) = \lambda_j(u). \end{cases} \quad (5.1)$$

The ratio function $r_i(u)$, $i = 1, 3$, is mapped to $\tilde{r}_{4-i}(u) = \tilde{\lambda}_{4-i}(u)/\tilde{\lambda}_2(u)$. Moreover φ is a homomorphism $\varphi(AB) = \varphi(A)\varphi(B)$. The map

$$\tilde{\varphi} : \begin{cases} \tilde{\mathcal{A}} & \rightarrow \mathcal{A}, \\ \tilde{T}_{ij}(u) & \rightarrow (-1)^{[\widetilde{i}][\widetilde{j}] + [\widetilde{j}] + 1} T_{4-j, 4-i}(u), \\ \tilde{\lambda}_j(u) & \rightarrow -\lambda_{4-j}(u) = \tilde{\lambda}_j(u), \end{cases} \quad (5.2)$$

is inverse to φ , i.e., $\tilde{\varphi} \circ \varphi = \text{id}$ and $\varphi \circ \tilde{\varphi} = \text{id}$, where id is the identity map on \mathcal{A} and $\widetilde{\text{id}}$ is the identity map on $\tilde{\mathcal{A}}$.

The (dual) Bethe vectors for the $\mathfrak{gl}(1|2)$ -invariant models were constructed in [18]:

$$\tilde{\mathbb{B}}_{a,b}(\bar{u}; \bar{v}) = (-1)^a \sum \frac{g(\bar{u}_{\text{I}}, \bar{v}_{\text{I}})f(\bar{v}_{\text{I}}, \bar{v}_{\text{II}})g(\bar{u}_{\text{II}}, \bar{u}_{\text{I}})h(\bar{v}_{\text{I}}, \bar{v}_{\text{I}})}{\tilde{\lambda}_2(\bar{u}_{\text{II}})\tilde{\lambda}_2(\bar{v})f(\bar{u}, \bar{v})} \tilde{\mathbb{T}}_{13}(\bar{v}_{\text{I}})\tilde{T}_{23}(\bar{v}_{\text{II}})\tilde{\mathbb{T}}_{12}(\bar{u}_{\text{II}})\tilde{\Omega}, \quad (5.3)$$

$$\tilde{\mathbb{C}}_{a,b}(\bar{u}; \bar{v}) = (-1)^{\frac{a(a-1)}{2}} \sum \frac{g(\bar{u}_{\text{I}}, \bar{v}_{\text{I}})f(\bar{v}_{\text{I}}, \bar{v}_{\text{II}})g(\bar{u}_{\text{II}}, \bar{u}_{\text{I}})h(\bar{v}_{\text{I}}, \bar{v}_{\text{I}})}{\tilde{\lambda}_2(\bar{u}_{\text{II}})\tilde{\lambda}_2(\bar{v})f(\bar{u}, \bar{v})} \tilde{\Omega}^\dagger \tilde{\mathbb{T}}_{21}(\bar{u}_{\text{II}})\tilde{T}_{32}(\bar{v}_{\text{II}})\tilde{\mathbb{T}}_{31}(\bar{v}_{\text{I}}), \quad (5.4)$$

where the sums go over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$ under the constraint $\#\bar{u}_I = \#\bar{v}_I$. We remind that the products of the odd operators $\tilde{T}_{1i}(u)$ and $\tilde{T}_{i1}(u)$, $i = 2, 3$, are symmetrised

$$\tilde{\mathbb{T}}_{1i}(\bar{u}) \equiv \frac{\tilde{T}_{1i}(u_1)\tilde{T}_{1i}(u_2)\cdots\tilde{T}_{1i}(u_n)}{\prod_{1 \leq j < k \leq n} h(u_k, u_j)}, \quad \tilde{\mathbb{T}}_{i1}(\bar{u}) \equiv \frac{\tilde{T}_{i1}(u_1)\tilde{T}_{i1}(u_2)\cdots\tilde{T}_{i1}(u_n)}{\prod_{1 \leq j < k \leq n} h(u_j, u_k)}. \quad (5.5)$$

If we assume that $\varphi(\Omega) = \tilde{\Omega}$ and $\varphi(\Omega^\dagger) = \tilde{\Omega}^\dagger$, it can be shown that

$$\varphi(\mathbb{B}_{a,b}(\bar{u}; \bar{v})) = \tilde{\mathbb{B}}_{b,a}(\bar{v}; \bar{u}), \quad \varphi(\mathbb{C}_{a,b}(\bar{u}; \bar{v})) = \tilde{\mathbb{C}}_{b,a}(\bar{v}; \bar{u}). \quad (5.6)$$

The coalgebraic structure on $\tilde{\mathcal{A}}$ and \mathcal{A} is related by the isomorphism φ in the following way:

$$\tilde{\Delta} \circ \varphi = (\varphi \otimes \varphi) \circ \Delta' \quad (5.7)$$

where Δ' is the opposite coproduct (2.11) on \mathcal{A} and $\tilde{\Delta}$ is the standard coproduct on $\tilde{\mathcal{A}}$

$$\tilde{\Delta}(\tilde{T}_{ij}(u)) = -\tilde{T}_{kj}(u) \otimes \tilde{T}_{ik}(u). \quad (5.8)$$

It seems useful to incorporate the minus in the definition of $\tilde{\Delta}$. This has a consequence for the pseudovacuum eigenvalues in the composite model: $\tilde{\lambda}_j(u) = -\tilde{\lambda}_j^{(1)}(u)\tilde{\lambda}_j^{(2)}(u)$. On the other hand, the ratio functions satisfy the same relation as for $\mathfrak{gl}(2|1)$: $\tilde{r}_j(u) = \tilde{r}_j^{(1)}(u)\tilde{r}_j^{(2)}(u)$.

5.1 Main results

From the above remarks and results of subsection 3.1 we can conclude about the form of Bethe vectors in the $\mathfrak{gl}(1|2)$ -invariant composite model. Similarly to the case of theorem 2 the proof of the following two theorems is based on the composition rule for the isomorphism φ with the coproducts $\tilde{\Delta}$ and Δ' .

Theorem 3. *The Bethe vectors of the full model can be expressed as the bilinear combination of the partial Bethe vectors:*

$$\tilde{\mathbb{B}}_{a,b}(\bar{u}; \bar{v}) = \sum \tilde{r}_3^{(1)}(\bar{v}_{II})\tilde{r}_1^{(2)}(\bar{u}_I) \frac{f(\bar{v}_I, \bar{v}_{II})g(\bar{u}_{II}, \bar{u}_I)}{f(\bar{u}_I, \bar{v}_{II})} \tilde{\mathbb{B}}_{a_1, b_1}^{(1)}(\bar{u}_I; \bar{v}_I) \tilde{\mathbb{B}}_{a_2, b_2}^{(2)}(\bar{u}_{II}; \bar{v}_{II}). \quad (5.9)$$

The summation goes over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_{II}\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_{II}\}$ with no restriction. The corresponding cardinalities satisfy $a_1 + a_2 = a$ and $b_1 + b_2 = b$.

Proof. Let $\tilde{B}_{ab}(\bar{u}; \bar{v})$ denote the polynomial in elements of $\tilde{\mathcal{A}}$ which acts on the pseudovacuum, i.e., $\tilde{\mathbb{B}}_{ab}(\bar{u}; \bar{v}) = \tilde{B}_{ab}(\bar{u}; \bar{v})\tilde{\Omega}$. We use the composition rule (5.7) and the results of theorem 1.

$$\begin{aligned} \tilde{\mathbb{B}}_{a,b}(\bar{u}; \bar{v}) &= \tilde{B}_{a,b}(\bar{u}; \bar{v})\tilde{\Omega} = \tilde{\Delta}(\tilde{B}_{a,b}(\bar{u}; \bar{v}))\tilde{\Omega}^{(1)}\tilde{\Omega}^{(2)} = \left[\tilde{\Delta} \circ \varphi(B_{b,a}(\bar{v}; \bar{u})) \right] \tilde{\Omega}^{(1)}\tilde{\Omega}^{(2)} \\ &= \left[(\varphi \otimes \varphi) \circ \Delta'(B_{b,a}(\bar{v}; \bar{u})) \right] \tilde{\Omega}^{(1)}\tilde{\Omega}^{(2)}. \\ &= \left[(\varphi \otimes \varphi) \sum r_1^{(1)}(\bar{v}_I)r_3^{(2)}(\bar{u}_{II}) \frac{f(\bar{v}_{II}, \bar{v}_I)g(\bar{u}_{II}, \bar{u}_{II})}{f(\bar{u}_{II}, \bar{v}_I)} B_{b_2, a_2}^{(1)}(\bar{v}_{II}; \bar{u}_{II}) B_{b_1, a_1}^{(2)}(\bar{v}_I; \bar{u}_I) \right] \tilde{\Omega}^{(1)}\tilde{\Omega}^{(2)}. \end{aligned} \quad (5.10)$$

We stress that there was again used the opposite coproduct (2.11) in contrast to theorem 1. The application of the map $\varphi \otimes \varphi$ maps not only the polynomials $B_{b_2, a_2}^{(1)}(\bar{v}_\Pi; \bar{u}_\Pi) B_{b_1, a_1}^{(2)}(\bar{v}_I; \bar{u}_I)$ to $\tilde{B}_{a_2, b_2}^{(1)}(\bar{u}_\Pi; \bar{v}_\Pi) \tilde{B}_{a_1, b_1}^{(2)}(\bar{u}_I; \bar{v}_I)$ but also $r_1^{(1)}(\bar{v}_I) r_3^{(2)}(\bar{u}_\Pi)$ to $\tilde{r}_3^{(1)}(\bar{v}_I) \tilde{r}_1^{(2)}(\bar{u}_\Pi)$. Hence,

$$\tilde{\mathbb{B}}_{a,b}(\bar{u}; \bar{v}) = \sum \tilde{r}_3^{(1)}(\bar{v}_I) \tilde{r}_1^{(2)}(\bar{u}_\Pi) \frac{f(\bar{v}_\Pi, \bar{v}_I) g(\bar{u}_I, \bar{u}_\Pi)}{f(\bar{u}_\Pi, \bar{v}_I)} \tilde{\mathbb{B}}_{a_2, b_2}^{(1)}(\bar{u}_\Pi; \bar{v}_\Pi) \tilde{\mathbb{B}}_{a_1, b_1}^{(2)}(\bar{u}_I; \bar{v}_I).$$

After renaming the sets of variables as $\bar{u}_I \leftrightarrow \bar{u}_\Pi$ and $\bar{v}_I \leftrightarrow \bar{v}_\Pi$, we arrive at the statement of the theorem. \square

Theorem 4. *The dual Bethe vectors of the full model can be expressed as the bilinear combination of the partial Bethe vectors:*

$$\tilde{\mathbb{C}}_{a,b}(\bar{u}; \bar{v}) = \sum \tilde{r}_3^{(2)}(\bar{v}_I) \tilde{r}_1^{(1)}(\bar{u}_\Pi) \frac{f(\bar{v}_\Pi, \bar{v}_I) g(\bar{u}_I, \bar{u}_\Pi)}{f(\bar{u}_\Pi, \bar{v}_I)} \tilde{\mathbb{C}}_{a_2, b_2}^{(2)}(\bar{u}_\Pi; \bar{v}_\Pi) \tilde{\mathbb{C}}_{a_1, b_1}^{(1)}(\bar{u}_I; \bar{v}_I). \quad (5.11)$$

The summation goes over all partitions $\bar{u} \Rightarrow \{\bar{u}_I, \bar{u}_\Pi\}$ and $\bar{v} \Rightarrow \{\bar{v}_I, \bar{v}_\Pi\}$ with no restriction. The corresponding cardinalities satisfy $a_1 + a_2 = a$ and $b_1 + b_2 = b$.

Proof. We use the results of theorem 2 and the composition rule (5.7). Everything is analogous to the proof of the previous theorem.

$$\begin{aligned} \tilde{\mathbb{C}}_{a,b}(\bar{u}; \bar{v}) &= \varphi(\mathbb{C}_{b,a}(\bar{v}; \bar{u})) = \tilde{\Omega}^\dagger \varphi(C_{b,a}(\bar{v}; \bar{u})) = \tilde{\Omega}^{\dagger(1)} \tilde{\Omega}^{\dagger(2)} \left[\tilde{\Delta} \circ \varphi(C_{b,a}(\bar{v}; \bar{u})) \right] \\ &= \tilde{\Omega}^{\dagger(1)} \tilde{\Omega}^{\dagger(2)} \left[(\varphi \otimes \varphi) \circ \Delta'(C_{b,a}(\bar{v}; \bar{u})) \right] \\ &= \tilde{\Omega}^{\dagger(1)} \tilde{\Omega}^{\dagger(2)} \left[(\varphi \otimes \varphi) \sum r_1^{(2)}(\bar{v}_\Pi) r_3^{(1)}(\bar{u}_I) \frac{f(\bar{v}_I, \bar{v}_\Pi) g(\bar{u}_\Pi, \bar{u}_I)}{f(\bar{u}_I, \bar{v}_\Pi)} C_{b_1, a_1}^{(2)}(\bar{v}_I; \bar{u}_I) C_{b_2, a_2}^{(1)}(\bar{v}_\Pi; \bar{u}_\Pi) \right] \\ &= \sum \tilde{r}_3^{(2)}(\bar{v}_\Pi) \tilde{r}_1^{(1)}(\bar{u}_I) \frac{f(\bar{v}_I, \bar{v}_\Pi) g(\bar{u}_\Pi, \bar{u}_I)}{f(\bar{u}_I, \bar{v}_\Pi)} \mathbb{C}_{a_1, b_1}^{(2)}(\bar{u}_I; \bar{v}_I) \mathbb{C}_{a_2, b_2}^{(1)}(\bar{u}_\Pi; \bar{v}_\Pi). \end{aligned}$$

Renaming the sets of variables as $\bar{u}_I \leftrightarrow \bar{u}_\Pi$ and $\bar{v}_I \leftrightarrow \bar{v}_\Pi$ leads to the statement of the theorem. \square

6 Conclusion

We have obtained explicit formulas for the Bethe vectors for the composite $\mathfrak{gl}(2|1)$ - and $\mathfrak{gl}(1|2)$ -invariant generalized quantum integrable models. The method of calculation of Bethe vectors for the composite $\mathfrak{gl}(2|1)$ -invariant model was straightforward. We used the known action of the monodromy matrix elements on the Bethe vectors [5]. Since the RTT algebra \mathcal{A} has the structure of a bialgebra, we expressed the action of the monodromy matrix elements of the full model on the tensor product of the superspaces of the partial models using the coproduct in \mathcal{A} . The corresponding dual Bethe vectors were obtained using certain antimorphism on \mathcal{A} . Similarly, the (dual) Bethe vectors for the $\mathfrak{gl}(1|2)$ -invariant model were obtained with the help of isomorphism of the RTT algebras \mathcal{A} and $\tilde{\mathcal{A}}$.

The authors of [16] used apart from this approach also the coproduct property of the weight functions [11]. As there are no similar results established in the case of superalgebras, we used in this article the only known method to find the Bethe vectors for the composite model.

We are now prepared to calculate the form factors of the partial monodromy elements $T_{ij}^{(\ell)}(u)$ in the basis of the Bethe vectors of the full model. They allow one to calculate form factors of local operators depending on an internal point of the original interval $[0, L]$. The correlation functions of these operators can be consequently investigated.

Our next publication will be devoted to the investigation of form factors of the partial monodromy matrix elements using the method of zero modes [17].

Acknowledgements

A Action of monodromy matrix elements on Bethe vectors

We list here some useful formulas. The summation is usually performed over all partitions of the type $\bar{u} \Rightarrow \{u_0, \bar{u}_0\}$ and $\bar{v} \Rightarrow \{v_0, \bar{v}_0\}$ where $\#u_0 = \#v_0 = 1$. It also happens that the summation goes over all partitions of the type $\bar{u} \Rightarrow \{u_0, u_1, \bar{u}_2\}$ with the condition $\#u_0 = \#u_1 = 1$. All formulas listed in this appendix are special cases of the results obtained in [5].

- Action of the diagonal elements:

$$\begin{aligned} \frac{T_{11}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= r_1(z)\frac{f(\bar{u}, z)}{h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) \\ &+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} r_1(u_0)\frac{g(z, u_0)f(\bar{u}_0, u_0)g(\bar{v}, z)}{f(\bar{v}, u_0)}\mathbb{B}_{a,b}(\{z, \bar{u}_0\}; \bar{v}) \\ &+ \sum_{\substack{\bar{u} \Rightarrow \{u_0, \bar{u}_0\} \\ \bar{v} \Rightarrow \{v_0, \bar{v}_0\}}} r_1(u_0)\frac{f(\bar{u}_0, u_0)g(z, v_0)g(\bar{v}_0, v_0)}{f(\bar{v}_0, u_0)h(v_0, z)h(v_0, u_0)}\mathbb{B}_{a,b}(\{z, \bar{u}_0\}; \{z, \bar{v}_0\}), \end{aligned} \quad (\text{A.1})$$

$$\begin{aligned} \frac{T_{22}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= f(z, \bar{u})g(\bar{v}, z)\mathbb{B}_{a,b}(\bar{u}; \bar{v}) \\ &+ \sum_{\bar{v} \Rightarrow \{v_0, \bar{v}_0\}} \frac{f(z, \bar{u})g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, z)}\mathbb{B}_{a,b}(\bar{u}; \{z, \bar{v}_0\}) \\ &+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} g(u_0, z)f(u_0, \bar{u}_0)g(\bar{v}, z)\mathbb{B}_{a,b}(\{z, \bar{u}_0\}; \bar{v}) \\ &+ \sum_{\substack{\bar{u} \Rightarrow \{u_0, \bar{u}_0\} \\ \bar{v} \Rightarrow \{v_0, \bar{v}_0\}}} \frac{g(u_0, z)f(u_0, \bar{u}_0)g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, z)}\mathbb{B}_{a,b}(\{z, \bar{u}_0\}; \{z, \bar{v}_0\}), \end{aligned} \quad (\text{A.2})$$

$$\begin{aligned}
\frac{T_{33}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= r_3(z)g(\bar{v}, z)\mathbb{B}_{a,b}(\bar{u}; \bar{v}) \\
&+ \sum_{\bar{v} \Rightarrow \{v_0, \bar{v}_0\}} r_3(v_0) \frac{f(z, \bar{u})g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, z)f(v_0, \bar{u})} \mathbb{B}_{a,b}(\bar{u}; \{z, \bar{v}_0\}) \\
&+ \sum_{\substack{\bar{u} \Rightarrow \{u_0, \bar{u}_0\} \\ \bar{v} \Rightarrow \{v_0, \bar{v}_0\}}} r_3(v_0) \frac{g(u_0, z)f(u_0, \bar{u}_0)g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, u_0)f(v_0, z)f(v_0, \bar{u}_0)} \mathbb{B}_{a,b}(\{z, \bar{u}_0\}; \{z, \bar{v}_0\}).
\end{aligned} \tag{A.3}$$

- Action of the upper-triangular elements:

$$\frac{T_{13}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) = \mathbb{B}_{a+1,b+1}(\{z, \bar{u}\}; \{z, \bar{v}\}), \tag{A.4}$$

$$\begin{aligned}
\frac{T_{23}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= f(z, \bar{u})\mathbb{B}_{a,b+1}(\bar{u}; \{z, \bar{v}\}) \\
&+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} g(u_0, z)f(u_0, \bar{u}_0)\mathbb{B}_{a,b+1}(\{z, \bar{u}_0\}, \{z, \bar{v}\}),
\end{aligned} \tag{A.5}$$

$$\begin{aligned}
\frac{T_{12}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= g(\bar{v}, z)\mathbb{B}_{a+1,b}(\{z, \bar{u}\}; \bar{v}) \\
&+ \sum_{\bar{v} \Rightarrow \{v_0, \bar{v}_0\}} \frac{g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, z)}\mathbb{B}_{a+1,b}(\{z, \bar{u}\}; \{z, \bar{v}_0\}).
\end{aligned} \tag{A.6}$$

- Action of the lower-triangular elements:

$$\begin{aligned}
\frac{T_{21}(z)}{\lambda_2(z)h(\bar{v}, z)}\mathbb{B}_{a,b}(\bar{u}; \bar{v}) &= \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} r_1(z) \frac{f(u_0, z)f(u_0, \bar{u}_0)f(\bar{u}_0, z)g(\bar{v}, z)}{f(\bar{v}, z)h(u_0, z)} \mathbb{B}_{a-1,b}(\bar{u}_0; \bar{v}) \\
&+ \sum_{\bar{u} \Rightarrow \{u_0, \bar{u}_0\}} r_1(u_0) \frac{f(z, u_0)f(z, \bar{u}_0)f(\bar{u}_0, u_0)g(\bar{v}, z)}{f(\bar{v}, u_0)h(z, u_0)} \mathbb{B}_{a-1,b}(\bar{u}_0; \bar{v}) \\
&+ \sum_{\bar{u} \Rightarrow \{u_0, u_1, \bar{u}_2\}} r_1(u_0) \frac{f(u_1, u_0)f(u_1, \bar{u}_2)f(u_1, z)f(\bar{u}_2, u_0)f(z, u_0)g(\bar{v}, z)}{f(\bar{v}, u_0)h(u_1, z)h(z, u_0)} \\
&\quad \times \mathbb{B}_{a-1,b}(\{z, \bar{u}_2\}; \bar{v}) \\
&+ \sum_{\substack{\bar{u} \Rightarrow \{u_0, \bar{u}_0\} \\ \bar{v} \Rightarrow \{v_0, \bar{v}_0\}}} r_1(u_0) \frac{f(z, \bar{u}_0)f(\bar{u}_0, u_0)g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, z)f(\bar{v}_0, u_0)h(v_0, u_0)} \mathbb{B}_{a-1,b}(\bar{u}_0; \{z, \bar{v}_0\}) \\
&+ \sum_{\substack{\bar{u} \Rightarrow \{u_0, u_1, \bar{u}_2\} \\ \bar{v} \Rightarrow \{v_0, \bar{v}_0\}}} r_1(u_0) \frac{f(u_1, u_0)g(u_1, z)f(u_1, \bar{u}_2)f(\bar{u}_2, u_0)g(z, v_0)g(\bar{v}_0, v_0)}{h(v_0, z)f(\bar{v}_0, u_0)h(v_0, u_0)} \\
&\quad \times \mathbb{B}_{a-1,b}(\{z, \bar{u}_2\}; \{z, \bar{v}_0\}).
\end{aligned} \tag{A.7}$$
